

Wealth OS

The family wealth command center - every stock, fund, property, car, and cash account across every market and currency, in one calm, realtime dashboard. With a 6agent AI investing desk that watches your favorites 24/7 and grades its own calls.

Wealth OS turns a scattered financial life - brokerage apps, spreadsheets, property values in three currencies, a car depreciating in the garage - into a single, beautiful, profileaware network picture, backed by live market data and transparent, explainable AI.

Educational software, not financial advice. All AI output, sentiment scores, tax estimates, and ratings are informational. Always verify with a professional and the linked primary sources (Morningstar, Simply Wall St, GuruFocus, etc.).

Why Wealth OS

Most people's wealth lives in 5-10 disconnected places: a domestic broker, an international broker, a crypto exchange, mutualfund platforms, real estate, gold, and cash in several banks. No single app shows the *whole* picture - across currencies, countries, and family members - and almost none explain *why* something moved or *what to do next*.

Wealth OS answers four questions in one place:

1. What do I own? - Holdings, funds, bonds, property, cars, gold, and cash, normalized to one display currency.
 2. What is it worth right now? - Live quotes, FX, and perasset P/L, refreshed continuously.
 3. Why did it move, and is it healthy? - Real technical indicators, sentiment gauges, warning signs, and links to professional ratings.
 4. What should I consider doing? - An interactive AI CFO and a multiagent AI Desk that issue plans (entry / target / stop) and grade their own accuracy over time.
-

Highlights

Multimarket, multicurrency

NYSE, NASDAQ, NSE, BSE, XETRA, LSE, TSE, HKEX, ASX, crypto & more - values normalized to your display currency with live FX.

Profiles & family view

Each member has an isolated portfolio; the family view aggregates everyone. Any profile - including the admin/owner - can be passwordprotected: set a password in the Profiles tab and the app then requires it every time anyone switches into that profile (only the profile currently in view stays unlocked), and relocks it on every page refresh (the app stays blurred behind the unlock prompt until the right password is entered). A Lock button in the top bar lets you lock the open profile on demand - e.g. when stepping away - and the app relocks automatically even when the page is restored from the browser's back/forward cache. Plus an "About Me" founder page with photo upload.

Real technical analysis

RSI(14), MACD(12,26,9), SMA50/200, 52week range - computed from live daily price history, not faked.

AI Investment Desk

Six cooperating agents watch favorites 24/7, issue buy calls with a plan, track them vs. your real entry, and selfimprove.

Interactive AI CFO

Ask about cashflow, concentration risk, buy zones, goals, property, and tax - answered from *your* live portfolio.

Live market status

Perexchange open/closed with a pulsing dot and a precise "opens in 9h 49m · 09:15 IST" countdown.

Premium charts

Crosshair, gradient fills, hover readouts, volume bars, donut toggles, and a Stocktwitsstyle sentiment gauge - across the whole app.

Property & car modeling

Inflation/locality price projection for homes, downward depreciation curves for cars, rental tracking, and percountry tax info.

Smart notifications

52weeklow alerts, big movers, RSI extremes, triggered price targets, and AI greenlight buys.

Forex & market pulse

Live ECB major FX pairs, advancers/decliners breadth, mostvolatile movers, and an IPO calendar.

11 world languages

Onetap interface translation across English, Deutsch, , , Español, Français, (full RTL), , Português, and - from the top bar or Settings.

Rich settings

Theme (dark/light/auto), accent color, density, privacy blur, 12/24h clock, default currency, autorefresh, startup profile, language - plus a oneclick privacysafe JSON backup export (no passwords or API keys).

Screenshots

Add your own screenshots to docs/screenshots/ (./docs/screenshots/) and embed them here. Suggested shots: Mission Control · Live Markets · AI Desk · Asset Detail · About Me · the profile lock screen. (See docs/screenshots/README.md (./docs/screenshots/README.md) for file-name conventions.)

Screens & Features

- Welcome setup (first run) - A mandatory, validated 5step wizard that blurs the app until completed. It asks who the app is for (personal/family/business), your name, email, country, currency & language, and your risk/goal style. On finish it creates a brandnew profile for that user and lands them on it - the existing owner/admin profile is never renamed or overwritten. The last remaining admin profile can never be deleted, so the app always keeps an owner.
 - Mission Control - Network KPIs with countup animation, a live local clock + world clocks, marketstatus panel, wealthprojection chart with a live hover readout, and allocation/geography/sector/performance charts.
 - About Me - A founder/profile page: photo upload (autoresized), role, company, headline, bio, focus areas & interests (as tags), a milestones timeline, a motto, contact + social links, and a live wealthatag glance snapshot (net worth, holdings, real assets, family profiles).
 - Live Markets - Market comparison chart, Market Pulse (breadth/mood), Forex majors, MostActive/Volatile, top gainers/losers, global top assets, top coins, a perexchange calendar with live open/closed status, and an Exchange browser: pick an exchange (NASDAQ, NYSE, NSE India, Crypto...) to list every share & fund traded on it - searchable, paginated, with live prices and oneclick drilldown.
 - IPOs - Upcoming and recent IPOs grouped by exchange, with links to official IPO calendars.
 - Portfolio - Add/edit/sell holdings (with a proper Sell modal that routes proceeds to cashflow and a chosen bank cash account), portfoliomix donut, a combined Add Cash & Cashflow panel, and banktagged cash accounts (Axis, ICICI, SBI, HDFC, N26, ...).
 - Properties - Houses, cars, gold and more in any country/currency; inflation+locality price projection, car depreciation curves, rental status, and dispose (sell/gift) flow.
 - Alerts & Plans - Price alerts and savings goals.
 - Favorites - A watchlist with quick stats and oneclick open. Add a favorite with the search box at the top (any stock/ETF/fund/coin), the on any Asset Detail page, or "Add favorite" on movers/screeners.
 - AI Desk - The multiagent investing engine (see below).
 - Screeners - Bullish/Bearish technical screens with the sentiment gauge, MACD meter, RSI bar, smartmoney score, and insidertrading data.
 - Compare - Sidebyside asset comparison.
 - News - Real, deduplicated articles with images and source links (no empty/dead links).
 - Funds & Bonds - Mutualfund and bond tracking with NAV history.
 - Asset Detail - A full instrument page: interactive price chart (crosshair, volume, range tabs), performance/dividends/price/profile/edit tabs, technical readout with sentiment gauge, ratings & warning signs, and real news.
 - AI CFO - A conversational analyst grounded in your portfolio.
 - Brokers - Connector status & sync scaffolding for Trading 212, IBKR, Zerodha/Coin, Coinbase, Groww, Scalable Capital, MF Central.
-

The AI Investment Desk (USP)

A transparent, sixagent quant pipeline that runs over everything in your Favorites, grouped by exchange. It is grounded in public investing principles - *margin of safety, business quality, trend, momentum, meanreversion, and hard risk management* - and it grades and retunes itself.

Agent

Role

Watcher

Tracks every favorite live, per exchange, 24/7 (background async loop).

Analyst

Scores 6 factors - trend, momentum, value, quality, risk, income - into a 0-100 composite.

Strategist

Predicts direction, confidence, target zone, and horizon.

Advisor

Issues BUY / HOLD / TRIM calls with a full plan: entry, target, stop, riskreward.

Tracker

When you log a buy at your real price, monitors it live and autocloses win/loss at target/stop.

Rater

Grades hitrate, win/loss split, average P/L (closed and open), and best/worst calls into an AI rating dial with a plainlanguage verdict, and autotunes the factor weights toward what actually worked.

When score, trend, and riskreward all line up, the asset gets a green light with a oneclick *"I bought this - track it"* flow so the desk can measure its own accuracy and improve. Greenlight buys also surface in the notification center.

Architecture

Front

- Backend is a single FastAPI app. Live data is fetched on demand via httpx and cached to stay within freetier limits. All user data persists to a simple JSON store (backend/data/state.json) - no database required to run.
- Frontend is a dependencyfree singlepage app: one pages array drives navigation, show(page) toggles .page.active sections, and a single state object holds client data. Charts use Chart.js via CDN. Cachebusting ?v= query strings on CSS/JS.
- Resilience: every live call has a graceful fallback (cached, sample, or demo data) so the dashboard never goes blank.

Tech Stack, Languages & Tooling

Layer

Technology - Why

Languages

Python 3.12, JavaScript (ES2020), HTML5, CSS3 - Backend logic in Python; frontend is dependencyfree vanilla JS.

Backend framework

FastAPI + Uvicorn (ASGI) - Fast async APIs, automatic OpenAPI/Swagger docs at /docs.

Validation

Pydantic v2 - Typed request/response models, input validation.

HTTP client

httpx (async) - Concurrent calls to market/FX/news providers.

PDF/report

ReportLab - Report generation support.

Frontend

Vanilla JS (no framework, no build step) - Zero toolchain - just static files served by any web server.

Charts

Chart.js (via CDN) - Line/bar/donut charts + custom crosshair, gradient, volume & sentimentgauge plugins.

Styling

CSS3 with customproperty design tokens + color-mix() - Light/dark theming, one shared stylesheet.

Fonts

Inter (body) + Sora (headings) via Google Fonts - -

Containerization

Docker + dockercompose - One command to run backend + frontend.

Web server (prod)

Nginx (serves the static frontend) - Lightweight static hosting; backend stays separate.

Persistence

JSON file (backend/data/state.json) - No database to install - see Database & Storage (#database--storage).

Indicators (inhouse)

RSI(14), MACD(12,26,9) via EMA + Wilder smoothing, SMA50/200, 52week range - Computed from live daily price history, not thirdparty.

No build step, no bundler, no Node.js required for the frontend - index.html, app.js, and styles.css are plain static files.

Frontend

- What it is: a singlepage app made of exactly three static files - frontend/index.html (the shell + all page sections + modals), frontend/js/app.js (~300 KB of app logic), and frontend/css/styles.css (~110 KB design system).
- No framework / no build: plain ES2020 JavaScript. Nothing to npm install, transpile, or bundle. Edit a file, refresh the browser.
- How it works: a `pages[]` array drives the sidebar nav; `show(page)` toggles the matching `<section class="page">`; a single state object holds all client data; `get/post/patch/del` helpers talk to the backend; `loadAll()` fans out to persection loaders and renders.
- Charts: one shared `chart()` helper plus custom Chart.js plugins (crosshair, gradient fills, rounded bars, donut cutouts, the interactive asset chart, and the SVG sentiment gauge).
- Served by: any static file server - Nginx (in Docker), python -m http.server, or similar. It calls the backend at `http://localhost:8000` (configurable via `window.WEALTH_OS_API`).

Backend

- What it is: a single FastAPI application (backend/app/main.py, ~2,800 lines) exposing 65 REST endpoints, plus two integration modules (live_market.py, brokers.py) and a persistence module (data_store.py).
 - Async live data: market/FX/news are fetched on demand with httpx and cached inmemory to respect freetier limits. Every call has a graceful fallback so the dashboard never goes blank.
 - AI engines: the AI CFO and the 6agent AI Investment Desk (scoring, strategy, advice, selfgrading Tracker/Rater) plus a 24/7 background asyncio watch loop.
 - Auto docs: interactive Swagger UI at <http://localhost:8000/docs>, OpenAPI JSON at /openapi.json.
 - Statelessish: the only state is the JSON file below; restartsafe and easy to back up (just copy one file).
-

Database & Storage

Wealth OS needs NO database server. There is nothing to install, provision, or connect - no PostgreSQL, MySQL, MongoDB, Redis, etc.

- Persistence model: all user data (profiles, holdings, properties, cashflow, cash accounts, watchlist, alerts, savings plans, broker details, and AI Desk state) is stored in a single JSON file: backend/data/state.json.
 - How it works: on startup the backend loads that file into inmemory Python structures; after every change it writes the file back (load_data() / save_data() in services/data_store.py).
 - Size: tiny. A fullypopulated multiprofile install is around ~80-100 KB. It grows slowly and linearly with the number of holdings/AI calls; even heavy use stays in the low singledigit megabytes.
 - Backups: copy state.json (the app also writes occasional state.backup.*.json snapshots). The file is gitignored because it contains personal financial data - a fresh clone boots from builtin seed/demo data so the dashboard is never empty.
 - Want a real DB later? The store is isolated in one module, so swapping the JSON file for SQLite/Postgres is a contained change (see Roadmap (#roadmap)).
-

System Requirements & Footprint

Wealth OS is deliberately lightweight - it runs comfortably on a laptop or the smallest cloud VM.

Resource

Requirement / Footprint

OS

macOS, Linux, or Windows (Docker or native Python).

Python

3.11+ (Docker image uses 3.12slim; tested up to 3.13).

Backend dependencies

6 packages, ~60 MB installed (fastapi, uvicorn, pydantic, httpx, python-multipart, reportlab).

Frontend

~460 KB total of static files. No Node.js, no build artifacts.

Backend source

~0.5 MB of code.

User data

~80-100 KB (state.json); low singledigit MB at heavy use.

Docker images

Backend 300-400 MB (python:3.12-slim + deps); frontend uses nginx:alpine (~25 MB).

RAM

Comfortable in ~128-256 MB; runs fine on a 512 MB instance.

Disk

A few hundred MB total with Docker images; < 5 MB for the app code + data alone.

Network

Outbound HTTPS to public market/FX/news APIs (works with zero API keys).

Ports

Backend 8000, frontend 3000 (configurable).

Quick Start

Option A - Docker (recommended)

```
docker compose down          # stop anything old
```

docker co

Open <http://localhost:3000>. The backend API runs on <http://localhost:8000>.

Option B - Local dev (no Docker)

Backend:

```
cd backend
```

python -r

Frontend (any static server):

```
cd frontend
```

python -r

Then open <http://localhost:3000>.

The app works out of the box with no API keys - it uses free public endpoints (Yahoo, CoinGecko, ECB/Frankfurter) and falls back to sample data where a key is required.

Configuration

All configuration is via environment variables (see `docker-compose.yml`). Everything is optional - the app runs without any of these.

Variable

Purpose

CORS_ORIGINS

Comma-separated allowed origins for the frontend.

USE_LIVE_DATA

true to fetch live data, false for demo mode.

FINNHUB_API_KEY

Richer IPO calendar + company news.

NEWSAPI_KEY, ALPHA_VANTAGE_API_KEY

Optional news/market enrichment.

TRADING212_API_KEY, COINBASE_*, ZERODHA_*, GROWW_API_KEY, SCALABLE_API_KEY, MFCENTRAL_API_KEY, IBKR_*

Readonly broker connectors (bring your own keys; never store passwords).

Project Structure

wealth-os/

README.r

API Overview

65 REST endpoints. A representative selection:

Portfolio & profiles

GET /dashboard · GET /wealth-score · GET /allocations · GET /holdings · POST /holdings · PATCH /holdings/{symbol} · GET/POST/PATCH/DELETE /profiles · GET/POST/PATCH/DELETE /cash-accounts · GET/POST/DELETE /cashflow · GET/POST/DELETE /properties · POST /properties/{id}/dispose · GET /export (privacy-safe JSON backup)

Markets & data

GET /markets/movers · GET /markets/global-top · GET /exchange/listings (all shares of an exchange) · GET /asset-detail · GET /asset-history · GET /live/price (nearrealtime tick) · GET /market-status · GET /market-calendar · GET /forex · GET /fx-rates · GET /ipos · GET /funds-bonds · GET /insider-trading · POST /search · GET /tax-info

AI

POST /ai-cfo · GET /ai-desk · POST /ai-desk/track · POST /ai-desk/close/{id} · GET /ai-desk/events

Other

GET /watchlist · GET/POST /alerts · GET/POST /savings-plans · GET /news-center · GET /brokers/status · POST /brokers/sync/{broker}

Interactive API docs are available at <http://localhost:8000/docs> (FastAPI Swagger UI).

Data Sources

Market data is fetched directly from each exchange's public data - a price is the same regardless of which broker holds the asset - so no broker login is needed for live quotes. Every market has a keyless source plus fallbacks, and the Brokers -> Market Data Providers panel shows each exchange live in real time (GET /live/providers).

Source

Used for - Key?

Yahoo Finance

US (NYSE/Nasdaq), EU (XETRA/LSE/Euronext), India (NSE/BSE) stocks & ETFs, metals, OHLCV history, search - keyless

CoinGecko

Crypto - any coin, with full price history & technicals - keyless

Coinbase

Crypto spot price (keyless backup) - keyless

Binance

Crypto price + 24h change (keyless backup) - keyless

MFAPL.in (AMFI)

Indian mutualfund NAV history + full fund master - keyless

Nasdaq Trader directory

Full NASDAQ / NYSE / AMEX listed security lists (exchange browser) - keyless

NSE archives

Full NSE India equity and ETF lists (exchange browser) - keyless

Finnhub ***(optional key)***

US backup quotes/news (free); full international symbol directories need a paid Finnhub plan - key

*Exchange-browser coverage: *Full directory* (every listing) is available keyless for NASDAQ, NYSE, AMEX, NSE India, Crypto, India MFs. Other world exchanges (Frankfurt/XETRA, LSE, Euronext, Tokyo, HK, ...) have no free full feed, so they show a handcurated list of *major companies & ETFs* (DAX, FTSE, CAC...). Their complete directories require a paid marketdata plan (Finnhub international, EODHD, etc.); the connector is wired and activates automatically when such a key is added.*

ECB / Frankfurter

Live foreignexchange rates & forex pairs - keyless

Google News RSS

Real, sourced article headlines - keyless

Finviz

Insidertrading & screener data - keyless

Twelve Data / Finnhub / Alpha Vantage ***(optional)***

Higherlimit backup stock quotes & company news - free key

Crypto fallback chain: CoinGecko (full history) -> Yahoo (SYMUSD) -> Coinbase spot -> Binance 24h - so any coin stays live even if one source is down.

All thirdparty ratings (star ratings, fair value, DCF, financialhealth) are deeplinked to Morningstar, Simply Wall St, and GuruFocus rather than reproduced - verify before any decision.

Challenges Faced & Engineering Notes

Building a *live*, multimarket wealth dashboard with zero paid data subscriptions turned out to be the hardest part of the project. The honest engineering story:

Challenge

What happened - How it was solved

"Realtime" data is mostly paid

Almost every true tickbytick / streaming market API (and many "free" REST quote endpoints) is paywalled, requires OAuth, or is IPblocked for servers/datacenters. - Built a multiprovider fallback chain that fetches directly from each

exchange's *public* endpoints and degrades gracefully (cached -> alternate provider -> sample) so the dashboard never goes blank.

Endpoints blocked from the server

Several otherwise useful sources return 401/403/429/451 when called from a cloud IP rather than a browser - e.g. Stooq, the NSE realtime quote API, and Yahoo's v7 batchquote endpoint. - Rerouted to sources that *do* allow programmatic access: Yahoo's chart endpoint (for quotes + OHLCV history), CoinGecko, Coinbase, Binance, MFAPI.in, and Frankfurter/ECB.

Freetier rate limits

Hammering providers on every page load/refresh quickly hit limits and made the app slow. - Added an inmemory TTL cache (get_cache/set_cache) with perkey expiry, plus a nearrealtime tick cache (~12 s) and a 30 s profiles cache.

Search was slow (10-17 s)

The first version livepriced the *entire* searchable universe on every keystroke. - Switched to a cheap metadata catalog + cacheonly quotes, and fixed result ranking (exact ticker/price matches first, crypto demoted unless cryptospecific).

Profiles screen was slow (8-24 s)

It computed every profile's full live dashboard sequentially. - Parallelized with asyncio.gather + a 30 s cache with explicit invalidation on profile changes.

Currency chaos

Assets priced in USD/EUR/GBP/INR/JPY across many countries. - Everything is normalized to EUR internally and converted to your chosen display currency with live FX; FD/property currencies follow sensible percountry rules.

Genuine technical indicators

Many apps fake RSI/MACD. - Computed inhouse (RSI14, MACD12/26/9 via EMA + Wilder smoothing, SMA50/200, 52week range) from real daily price history.

No database, but must be safe

Wanted zeroinstall persistence without corrupting real financial data. - A single JSON store (state.json) with atomic load/save, seed data for fresh clones, and periodic backup snapshots.

Perprofile privacy

Family members shouldn't see each other's numbers. - Perprofile isolation + password locking, a manual Lock button, and relock on refresh / backforwardcache restore.

Exchange "list every share"

No single free feed lists *all* world equities. - Used the Nasdaq Trader directory (US) and NSE archives (India) for full keyless lists; curated majorcompany lists for exchanges with no free feed.

Known Limitations & API Reality Check

Wealth OS is built to run on 100% free, keyless data - which is great for cost and privacy, but it means some things are intentionally *goodenough* rather than *institutionalgrade*. Being upfront about exactly what does and doesn't work:

- Nearrealtime, not tickbytick. Free sources are delayed and polled (the app refreshes on an interval and caches ~12 s), so prices "fluctuate" with a small lag rather than streaming live. True live streaming needs a paid websocket feed (e.g. a broker API or a marketdata vendor).
- Full "all shares of an exchange" is only keyless for some markets. Complete directories work for NASDAQ, NYSE, AMEX, NSE India, Crypto, and Indian mutual funds. For Frankfurt/XETRA, LSE, Euronext, Tokyo, Hong Kong, ASX, there is no free full feed, so the Exchange browser shows a curated list of major companies & ETFs (DAX, FTSE, CAC...). The full lists need a paid plan (Finnhub international, EODHD, etc.) - the connector is wired and turns on automatically when a key is added.
- Finnhub free tier = US only. International symbol directories and much company data require a paid Finnhub

plan.

- Some intraday quotes are serverblocked. A handful of exchanges (notably NSE intraday) block serverside calls; those fall back to Yahoo or cached values.
- Brokers are readonly scaffolding. Most retail brokers (Trading 212, Groww, MF Central, Scalable Capital, Zerodha) have no free, official OAuth for thirdparty apps, so live autosync isn't possible without paid/partner access. Use CSV / statement import instead (drop a SIP/holdings CSV in the Brokers tab and it autoroutes).
- Professional ratings are linked, not reproduced. Morningstar star ratings, Simply Wall St fair value, GuruFocus DCF, etc. are deeplinked (licensing) rather than shown inside the app - open the link to verify.
- News is headlines + sources, not full articles. Google News RSS gives real, sourced headlines and links; full article text/paywalls are out of scope.
- The AI is an explainable rulesbased quant, not a paid LLM. The AI Desk's scoring/strategy/advice and the AI CFO answers are deterministic and transparent (grounded in your live portfolio) so they need no external LLM subscription - that's a deliberate tradeoff vs. openended generative chat.
- Singlefile storage = single device. Without a database there's no multidevice sync; copy state.json to move data. (A Postgres option is on the Roadmap (#-roadmap).)
- Profile lock is applevel, not server auth. The lock blurs the UI and gates switching; for a true multitenant hosted deployment you'd add real serverside authentication.

Bottom line: with no keys at all, you get reliable liveish prices for US + EU + India stocks/ETFs, all crypto, Indian mutual funds, FX, and gold/silver. Everything that "doesn't fully work" traces back to a paid or accessrestricted API, and each has a clearlywired upgrade path the moment a key is supplied.

User Guide

A friendly, nontechnical stepbystep user guide ships with the repo - ideal for anyone asking "the AI Desk is empty, why can't I see anything?" (answer: add a few Favorites first, then the desk analyzes them).

- Wealth-OS-User-Guide.pdf (./Wealth-OS-User-Guide.pdf) - printable PDF.
- Wealth-OS-User-Guide.docx (./Wealth-OS-User-Guide.docx) - editable Word version.

It covers firstrun setup, a tour of every screen, the "why is this empty?" troubleshooting FAQ, how to add holdings/favorites/SIPs, profiles & passwords, currencies, backups, and which markets are live for free.

Design System

- Type: Inter (body) + Sora (headings) via Google Fonts.
- Tokens: CSS custom properties (--blue, --green, --red, --radius, --shadow, --line, ...) with color-mix() for tints; full light/dark theme via body.light.
- Charts: shared premium helper - gradient line fills, dashed crosshair, styled dark tooltips, rounded colorcoded bars, donut cutouts, and a live hover readout header.
- Motion: countup KPIs, page fades, skeleton loaders, an animated stockgraph loading sign, and a pulsing "market open" dot.

Maintaining This Project

A few conventions to keep the repo healthy:

- Keep docs in sync with code. Whenever a feature, endpoint, env var, or dependency changes, update this

README in the same commit (the section list above is the source of truth for what the app does).

- Bump the cache version. After editing frontend/js/app.js or frontend/css/styles.css, bump the ?v= query string on both <link>/<script> tags in index.html so browsers fetch the new files.
 - Never commit personal data. backend/data/state.json is gitignored on purpose; the app seeds demo data for fresh clones.
 - One source of state. All persistence goes through services/data_store.py - don't write files elsewhere.
 - Fail soft. New livedata calls should always have a cached/fallback path so the dashboard never breaks.
-

Roadmap

- [] Persist AI sentiment history -> real "15 min / 1 day / 1 week ago" sentiment timeline.
 - [] Live ticking countdowns for market open/close without reselecting.
 - [] FXpair alerts and minisparklines in market rows.
 - [] Real broker OAuth pulls (currently readonly scaffolding + CSV/CAS import).
 - [] Optional database backend (Postgres) for multidevice sync.
 - [] Mobilenative wrapper.
-
