

Wealth OS - User Guide

Your whole financial world - stocks, funds, property, cars, gold and cash, across every market and currency - in one calm dashboard, with a self-grading AI investing desk.

Note: Educational software, not financial advice. Every AI call, score, rating and tax estimate is informational only. Always verify with primary sources and a qualified professional before acting.

1. What Wealth OS is (in one minute)

Most people's money lives in 5-10 disconnected places: a home broker, an international broker, a crypto exchange, mutual-fund apps, real estate, gold and several bank accounts. Wealth OS pulls all of it into a single, profile-aware net-worth picture with live prices and live currency conversion.

It answers four questions in one place:

- What do I own? - holdings, funds, bonds, property, cars, gold and cash.
- What is it worth right now? - live quotes + FX, with per-asset profit/loss.
- Why did it move and is it healthy? - real indicators, sentiment, warning signs.
- What should I consider? - an AI CFO chat and a 6-agent AI Desk that issues plans and grades itself.

2. Opening the app

- > Start the backend (data engine) and the frontend (the website) - see the README's Quick Start. With Docker it is one command; otherwise run the backend on port 8000 and the frontend on port 3000.
- > Open your browser at <http://localhost:3000>.
- > The first time, a Welcome Setup wizard appears (see the next section). After that the dashboard loads.

Note: You do NOT need any API keys or paid accounts. The app works out of the box using free public data.

3. First-run: the Welcome Setup

On a fresh device the app blurs and shows a mandatory 5-step wizard. You cannot skip it - it creates YOUR profile.

- > Welcome - a short intro.
- > Who is this for? - Personal, Family, or Business.
- > About you - your name (required), email (optional), country, display currency and language.
- > Your style - risk appetite, primary goal, and which asset tracks you care about.
- > Review - confirm, then Finish.

When you finish, Wealth OS creates a brand-new profile for you and takes you straight to it. The owner/admin profile is never overwritten, and the last remaining admin profile can never be deleted, so the app always has an owner.

4. The top bar (your controls)

- Search box - find any stock, ETF, fund or coin. Results open a PREVIEW first; they are not added to your portfolio automatically.
- Profile switcher - switch between profiles, or open the admin 'Family wealth' view (all profiles combined).
- Live toggle - pause/resume automatic price refresh. 'Live' = updating.
- Refresh (the circular arrow) - fetch fresh prices right now.
- Lock button (the padlock) - instantly lock the open profile (for a coffee break). The app blurs and asks for the password to resume. It stays online in the background.
- Language selector - switch the whole interface between 11 languages.
- Settings (the gear) - theme, currency, density, backups and more.
- Theme toggle - quick dark/light switch.

5. Quick-start checklist (do this first)

A fresh profile is EMPTY on purpose - Wealth OS never invents your money. Most screens stay blank until you add your own data. Do these in order:

- > Add your holdings - go to Portfolio and add each stock/ETF/coin (symbol, quantity, average price). This fills Mission Control, charts and allocations.
- > Add your cash & banks - in Portfolio, use Add Cash & Cashflow to record bank balances and income/expenses.
- > Add property, cars, gold - go to Properties for anything physical.
- > Add Favorites - this is what powers the AI Desk, Screeners and watchlist. Use the search box or the star on any asset page.
- > Add SIPs / mutual funds - in Funds & Bonds or by importing a CSV in the Brokers tab.

Note: If a screen looks empty, it almost always means 'you haven't added that type of data yet.' See the Troubleshooting FAQ at the end.

6. A tour of every screen

Mission Control

Your home dashboard: total net worth, a live clock and world clocks, market open/closed status, a wealth-projection chart, and allocation/geography/sector/performance charts. It shows zero until you add holdings and cash.

About Me

A personal profile page: photo, role, company, headline, bio, focus areas and interests, a milestones timeline, a motto, contact links, and a live wealth-at-a-glance snapshot. Click Edit to fill it in; it starts empty but is always present.

Live Markets

Market comparison chart, Market Pulse (breadth/mood), Forex majors, most-active and most-volatile movers, top gainers/losers, global top assets and top coins, plus a per-exchange

calendar with live open/closed status.

Exchange browser: pick an exchange (NASDAQ, NYSE, NSE India, Crypto...) to list its tradable shares & funds, searchable and paginated, with live prices and one-click drill-down. (Full lists are free for US, NSE India, Crypto and Indian mutual funds; other world exchanges show a curated list of major names - see the API note.)

IPOs

Upcoming and recent IPOs grouped by exchange, with links to the official IPO calendars.

Portfolio

The heart of the app. Add, edit and sell holdings. The Sell flow routes proceeds to your cashflow and a chosen bank account. There is a combined Add Cash & Cashflow panel and bank-tagged cash accounts (Axis, ICICI, SBI, HDFC, N26, ...).

- To add a holding: enter symbol, quantity and average buy price, then Add holding.
- Buttons (Add holding / Clear) and the import tools sit on the right of each panel.

Properties

Houses, cars, gold and more, in any country/currency. Includes inflation + locality price projection for homes, depreciation curves for cars, rental status, and a dispose (sell/gift) flow.

Alerts & Plans

Set price alerts on assets and create savings goals/plans. Triggered alerts show up in notifications.

Favorites (important!)

Your watchlist - and the fuel for the AI Desk and Screeners. Three ways to add a favorite:

- Type in the top search box and pick a result, then add it.
- Click the star on any Asset Detail page.
- Use 'Add favorite' on movers, screeners or Live Markets rows.

Note: If Favorites is empty, the AI Desk will also be empty - the desk only analyzes the assets you favorite.

AI Desk

A transparent 6-agent investing engine that runs over your Favorites, grouped by exchange: Watcher, Analyst, Strategist, Advisor, Tracker and Rater. It scores each favorite, predicts direction, issues BUY/HOLD/TRIM plans (entry, target, stop), and grades its own accuracy over time, auto-tuning what works.

Note: The AI Desk needs Favorites to do anything. Add a few favorites first, give it a moment to fetch data, and the cards appear. When score, trend and risk-reward align, an asset gets a 'green light' and a one-click 'I bought this - track it' option.

Screeners

Bullish/Bearish technical screens with a sentiment gauge, MACD meter, RSI bar, smart-money score and insider-trading data.

Compare

Put two or more assets side by side to compare price, performance and key stats.

News

Real, de-duplicated article headlines with images and source links. The News Center can scope to your holdings/favorites. (Headlines and links only - open the source for the full article.)

Funds & Bonds

Track mutual funds (with NAV history) and bonds. Indian mutual-fund NAVs come free from AMFI/MFAPI.

Asset Detail

Open any asset for a full page: interactive price chart (crosshair, volume, range tabs), a near-real-time price ticker, performance/dividends/price/profile/edit tabs, a technical read-out with sentiment gauge, ratings & warning signs (deep-linked to Morningstar, Simply Wall St, GuruFocus), and real news. Use the star here to favorite it.

AI CFO

A conversational analyst grounded in YOUR live portfolio. Ask about cashflow, concentration risk, buy zones, goals, property or tax, and it answers from your real numbers.

Brokers

Connection status for Trading 212, IBKR, Zerodha/Coin, Coinbase, Groww, Scalable Capital and MF Central, plus a place to record beneficiary/recovery info (never passwords).

Note: Most retail brokers offer no free official sync for outside apps, so use CSV import: drop a SIP or holdings CSV into the Brokers tab and Wealth OS auto-routes it to the right place. A sample SIP CSV is in the 'samples' folder.

Profiles

Create one profile per family member, each with its own holdings, property, cash and goals. Click a profile card to edit its name, relation, country, photo and password. You can also choose a different display currency just for this tab.

Settings

Theme (dark/light/auto), accent color, density, privacy blur, 12/24h clock, default display currency, auto-refresh interval, startup profile and language. Also includes a one-click privacy-safe JSON backup export (no passwords or API keys).

7. Profiles, passwords & locking

- Set a password: Profiles tab -> click a profile card -> type a password in the password field -> Update. A padlock icon appears on protected profiles.
- Switching: every time you switch INTO a password-protected profile, you must enter its password. Only the profile currently in view stays unlocked.
- Refresh: protected profiles re-lock on every page refresh - the app stays blurred behind the unlock prompt until you enter the password.
- Lock now: click the padlock button in the top bar to lock immediately (e.g. stepping away). Enter the password to resume.
- Family wealth (admin) view: shows everyone combined and requires the admin password.

Note: The lock secures the on-screen experience for personal/family use. It is an app-level lock (it blurs and gates the UI), not a hardened server login - that is the natural next step if you host this publicly.

8. Currencies & languages

- Display currency: set it in Settings (or just for the Profiles tab in that tab). All values convert live using real FX rates.
- Each profile shows in its own home currency by default; you can override it with the currency chips.
- Language: switch the entire interface between 11 languages from the top bar or Settings, including full right-to-left layout for Arabic.

9. Backups (don't skip this)

- Settings -> Export backup downloads a private JSON copy of your data (no passwords or API keys).
- All your data also lives in one file: backend/data/state.json. Copy it to back up or move to another machine.

Note: Because there is no cloud database, that one file IS your data. Back it up regularly.

10. Troubleshooting - "Why can't I see anything?"

Almost every 'empty' screen means the data for it hasn't been added yet. Here are the common ones:

Q: The AI Desk is empty / it shows nothing.

A: The AI Desk is empty if you haven't added any AI models yet. Add some, then refresh the desk.

Q: My Favorites list is empty.

A: Nothing is in your Favorites list yet. Add some, and check back.

Q: Mission Control / net worth shows 0.

A: You haven't added any assets yet. Add some, and check back. Cash is not counted.

Q: Prices aren't changing / not truly live.

A: Free prices are not truly live. To get live prices, you need to ensure that you have a live data source for the market you're interested in (India, etc).

Q: Live price for my specific exchange isn't updating.

A: Some exchanges are not supported yet. US (NYSE, NASDAQ) and Indian (NSE, BSE) are supported.

11. Which markets are live for free (summary)

- Reliable & keyless: US stocks/ETFs (NYSE, Nasdaq), EU stocks/ETFs (XETRA, LSE, Euronext), India stocks/ETFs (NSE, BSE), ALL crypto, Indian mutual funds (AMFI), FX/forex (ECB), and gold/silver.
- Curated (not full) without a key: complete share directories for Frankfurt, LSE, Euronext, Tokyo, Hong Kong, ASX.
- Needs a paid key: tick-by-tick streaming, international full directories, richer company fundamentals, and live broker auto-sync.

Disclaimer

Wealth OS is an educational and personal-finance organization tool. Nothing in it - including AI Desk calls, AI CFO answers, sentiment scores, technical read-outs, warning signs and tax estimates - is

financial, investment, legal or tax advice. Markets are risky; verify every figure with primary sources and a qualified professional before acting.

Wealth OS - see your whole financial world, clearly.
